

Shared AI Command System — Full Guide

A practical development workflow for ChatGPT + Cursor.

1. New Feature

```
/understand  
/add  
/architecture  
/plan  
/scheme /prisma  
/backend /api  
/frontend /reset  
/testing  
/review /security /performance  
/production  
/document
```

2. Debug and Fix

```
/understand  
/debug  
/architecture  
/fix  
/reconsider  
/testing  
/review  
/production
```

3. New PostgreSQL/Prisma Schema

```
/scheme /architecture  
/prisma  
/migration  
/testing  
/review /production
```

4. Backend API

```
/understand /backend  
/api  
/plan  
/backend /api /testing  
/review /security
```

5. Frontend Feature

```
/understand /frontend  
/ui /ui  
/plan  
/frontend /reset /testing  
/review
```

6. Full-stack Feature

```
/understand  
/plan  
/backend /api  
/frontend /reset  
/testing  
/review /security /performance  
/production  
/document
```

How to use a shortcut

Start a request with one or more shortcuts. The commands are composable. Use the repository's actual files and conventions as the source of truth. Do not let the AI invent APIs, schema fields, business rules, or existing behavior.

Example — new feature

`/feature /understand /plan`

I want to add Customer Follow-ups. First inspect the existing repository, identify the affected modules, and create an implementation plan. Do not code yet.

Example — bug

`/debug /fix /regression /testing`

The API returns a 500 error when creating a follow-up. Here are the logs and relevant files. Find the root cause, fix it, add a regression test, and explain how to verify the fix.

Example — schema

`/schema /prisma /migration /production`

Design the PostgreSQL schema for follow-ups, convert it to Prisma, review migration safety, and provide verification steps. Do not modify unrelated models.

Example — backend

`/backend /api /testing`

Implement CRUD endpoints using the existing Fastify, TypeScript, Prisma, validation, authentication, and error-handling conventions. Do not change frontend code.

Example — frontend

`/frontend /react /testing`

Implement the UI using the existing React components, routing, API client, forms, loading/error/empty states, and styling conventions. Do not change backend code.
